Database Fundamentals

A short test document for RAGdocAI

What is a Database?

A database is an organized collection of information that can be stored, searched, updated, and managed. A Database Management System, or DBMS, provides tools to work with databases.

Relational Databases

A relational database stores data in tables. Each table contains rows and columns. A primary key uniquely identifies a row. A foreign key connects a row in one table to a row in another table.

SQL

SQL stands for Structured Query Language. It is commonly used to create tables, insert records, retrieve information, update data, and delete records in relational databases.

Normalization

Normalization is the process of organizing relational database tables to reduce unnecessary duplication and improve data consistency. It commonly involves dividing data into related tables and defining relationships.

Prepared as sample content for local RAGdocAI testing.
